1. A kind of introduction 6
2. Historical survey of plasmons in composite systems 17
   - 2.1. Conventional (classical) structures 18
     - 2.1.1. Single surface/interface 18
     - 2.1.2. Thin films 23
   - 2.2. Systems with diminishing dimensions 25
     - 2.2.1. Inversion layers 25
     - 2.2.2. Quantum wells and superlattices 36
     - 2.2.3. Quantum wires and lateral superlattices 60
     - 2.2.4. Quantum dots and antidots 83
   - 2.3. Some variants of quantum structures 114
     - 2.3.1. Finite-size 2DEG 114
     - 2.3.2. Periodically modulated structures 123
       - 2.3.2.1. Electrostatic potential modulation 125
       - 2.3.2.2. Magnetic field modulation 135
     - 2.3.3. Hofstadter's butterfly spectrum 141
3. Methodologies for inhomogeneous plasmas 147
   - 3.1. Macroscopic model theories 148
   - 3.2. Microscopic model theories 150
   - 3.3. The strategy of working within the RPA 159
4. Plasmons on a semiconductor surface 167
   - 4.1. Zero magnetic field 169
   - 4.2. Non-zero magnetic field 170
     - 4.2.1. Voigt configuration 171
     - 4.2.2. Perpendicular configuration 173
     - 4.2.3. Faraday configuration 176
5. Plasmons in thin semiconducting films 178
   - 5.1. Zero magnetic field 178
     - 5.1.1. Supported films 179
     - 5.1.2. Unsupported films 180
   - 5.2. Non-zero magnetic field 181
     - 5.2.1. Voigt configuration 181
     - 5.2.2. Perpendicular configuration 184
     - 5.2.3. Faraday configuration 186
     - 5.2.4. Resonance splittings 188
6. Plasmons in double inversion layers 188
   - 6.1. DILs with zero thicknesses 190
     - 6.1.1. Zero magnetic field 193
     - 6.1.2. Non-zero magnetic field 194
     - 6.1.3. Effect of optical phonons in the spacer layer 196
   - 6.2. DILs with finite thicknesses 198
     - 6.2.1. Zero magnetic field 201
     - 6.2.2. Non-zero magnetic field 201
7. Plasmons in binary compositional superlattices 203
   - 7.1. Plasmon polaritons in metal–dielectric superlattices 207

Plasmons and magnetoplasmons in semiconductor heterostructures

Manvir S. Kushwaha

Instituto de Física, Universidad Autónoma de Puebla, Apdo. Post. J-48, Puebla 72570, Mexico

ELSEVIER

Amsterdam–London–New York–Oxford–Paris–Shannon–Tokyo

7.1.1. Collective excitations 207
7.1.2. Electron energy loss functions 210
7.2. Plasmon polaritons in semiconductor–dielectric superlattices 213
7.2.1. Zero magnetic field 214
7.2.2. Non-zero magnetic field 216
7.3. Plasmon polaritons in semiconductor–semiconductor superlattices 217
7.3.1. Zero magnetic field 219
7.3.2. Non-zero magnetic field 220
8. Plasmons in periodic multi-heterostructures 225
8.1. Semiconducting multi-heterostructures 228
8.2. Metallic multi-heterostructures 231
9. Plasmons in doping (n–i–p–i) superlattices 234
9.1. Zero magnetic field 236
9.2. Non-zero magnetic field 240
9.2.1. Voigt configuration — non-reciprocal propagation 240
9.2.2. Perpendicular configuration — collective excitations 243
10. Finite-size effects in superlattices 250
10.1. Compositional superlattices 252
10.2. Doping (n–i–p–i) superlattices 256
